Clean Agent Gas Suppression System (FK 5-1-12)

Model BT FK-5-1-12

Description:

Overview BT FK-5-1-12 is a pre-engineered clean agent suppression system that uses FK 5-1-12 to deliver rapid, residue free fire protection for sensitive and mission critical spaces. The system is engineered for fast knockdown, safe use around energized equipment, and minimal post event cleanup.

Key Features:

- **Agent:** FK 5-1-12 (clean, electrically non conductive vapor)
- **Discharge Pattern:** Engineered for uniform distribution and rapid concentration achievement
- **Installation:** Modular cylinder and manifold kits with BSP threaded nozzles; components secured to structural fixings
- **Actuation:** Electrical initiation with pneumatic pilot/master to slave release sequence
- **Nozzle:** 360° dispersion; multi orifice sizing in 0.1 mm increments for precise hydraulic balancing
- **Environmental Profile:** Low ozone depletion potential; suitable where ozone friendly agents are required

System Pressure	25 / 42 / 50 Bar Options
Approvals	UL Listed

Applications:

- Data centers and server rooms
- Telecommunications facilities
- Control rooms and electrical switchgear rooms
- Archives, museums, and libraries
- Medical equipment rooms and laboratories
- Any space requiring rapid, residue free fire suppression

Standards:

FK 5-1-1-12 complies with the following standards:

- Underwriters Laboratories Inc. (UL)
- US EPA SNAP Rpt.
- NFPA 2001 Clean Agent Fire suppression System
- ISO 14520-1 / ISO 14520 -5

Clean Agent Gas Suppression System (FK 5-1-12)

Model BT FK-5-1-12

System Components :

Clean Agent Gas System comprises pressurized cylinder(s), manifold (where required), connection and distribution piping, and nozzles. All proprietary components are supplied in kit form and must be secured to a suitable solid fixing point such as a wall or framework.

Storage Pressure and Agent State

- Reference temperature: 21 °C.
- Stored cylinder pressures: 25 bar; 42 bar; 50 bar (depending on cylinder type).
- Agent storage: Liquefied compressed gas in cylinders; discharged as a colorless, electrically non conductive vapor.

Design and Sizing

- Each BT FK-5-1-12 system is engineered specifically for the protected enclosure.
- Gas distribution and discharge time are controlled by correct nozzle orifice sizing; orifice sizes are engraved on the nozzle body.
- Cylinder and nozzle selection is based on room volume, hazard classification, and required design concentration.

Operation Sequence:

- An electrical signal actuates the solenoid device on the master or pilot cylinder.
- Operation of the master/pilot cylinder pressurizes the pneumatic actuating line.
- The pressurized actuating line operates the pneumatic release pistons on slave cylinders, causing them to discharge the agent into the protected space.
- Agent is expelled through the distribution piping and nozzles; correct orifice sizing ensures the required concentration and uniform distribution.

Mounting and Installation Notes:

- Components must be mechanically secured to solid fixings or structural supports.
- Piping and nozzles must be routed and positioned to achieve the designed discharge pattern and concentration.
- Manifolds are used where multiple cylinders feed a common distribution network.
- System commissioning must verify actuation sequence, pneumatic line integrity, and nozzle flow.

Fire Classes Suppressed

Class A	Surface fires / ordinary combustible materials
Class B	Flammable liquid fires
Class C	Energized electrical equipment fires

Safety and Serviceability:

- Systems must be installed, commissioned, and serviced by qualified personnel in accordance with applicable standards and local codes.
- Regular inspection and testing of cylinders, actuators, pneumatic lines, and detection interfaces are required.
- Follow manufacturer instructions for handling, storage, and cylinder replacement.

Sizing and Design Process

- Nozzle selection and orifice dimensions are established through hydraulic and discharge simulations (utilizing software like Jensen Hughes® or equivalent) by integrating critical parameters like protected volume, design concentration, piping configuration, cylinder pressure, discharge duration, and nozzle coordinates
- The software calculates the precise orifice diameters required to ensure target concentration levels and balanced agent distribution within the mandated discharge window.

Installation and Commissioning Notes

- Secure nozzle to distribution piping per system layout; ensure nozzle orientation allows unobstructed 360° discharge.
- Confirm engraved orifice size matches design documentation before commissioning.
- Commissioning must include verification of discharge pattern and system pressure drop consistent with design calculations.
- When replacing a nozzle, match the engraved orifice size and BSP thread to maintain system performance.

Maintenance and Service

- Inspection frequency as per manufacturer's guidance and local fire / civil defence code.
- Inspect nozzles for blockage, corrosion, or mechanical damage.
- Remove debris from orifices using non-metallic tools, avoid enlarging or deforming holes.
- Log nozzle orifice sizes and locations as part of the system as built documentation.

Clean Agent Gas Suppression System (FK 5-1-12)

Model BT FK-5-1-12

Cylinder Specifications, Welded - Standard Supply

Material	Mild Steel
Filling - General Cylinder	0.5 kg/L up to maximum of 1kg/L
Filling - Cylinder with Liquid Level Indicator	0.5 kg/L up to maximum of 0.8kg/L
Filling Pressure	25 bar @ 21°C
Test Pressure	63 bar
Standard of Compliance	TPED Directive 2010/35/EU
Colour	Red

Cylinder Specifications, Seamless - Optional Supply

Material	Chromium Molybdenum Alloy Steel
Filling - General Cylinder	0.5 kg/L up to maximum of 1kg/L
Filling Pressure	42 / 50 bar @ 21°C
Test Pressure	300 bar
Standard of Compliance	ISO 9809-1
Colour	Red

Clean Agent Gas Suppression System (FK 5-1-12)

Model BT FK-5-1-12

Nozzle

BT FK 5-1-12 360° Discharge Nozzle is a single variant type, full coverage nozzle designed for uniform agent distribution in protected enclosures. Each nozzle features 16 orifice holes and is available in multiple orifice sizes to meet system design requirements.

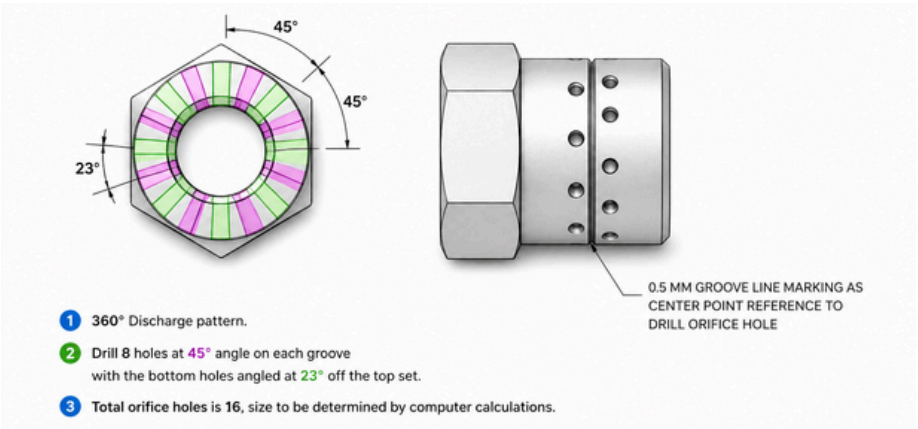

Key Features:

- **Discharge Pattern:** 360° uniform dispersion.
- **Number of Orifices:** 16 holes per nozzle.
- **Orifice Sizing Resolution:** 0.1 mm increments; holes are drilled to the exact diameter specified by the system design.
- **Thread Type:** BSP threaded connection for all nozzle sizes.
- **Identification:** Orifice size engraved on the nozzle body for easy verification during installation and maintenance.
